German engineering is known for its masterpieces around the world. KaVo handpieces are a part of this continuum of quality products developed with precision, professionalism and pride for more than a century.

The KaVo instruments are all developed, engineered and manufactured in Germany. In your practice they will form a team of players ready to aim for the same goal as you – better care for your patient. You will have the perfect solution whatever your clinical need.
Flexibility, efficiency, adaptability. Excellent characteristics in today’s work life across any profession. KaVo instruments follow the same principle: fourteen exchangeable heads to cover all your needs and applications, to help you achieve the best results.

Just couple any head with any shank to get an astonishing array of treatment possibilities. That way you will be set for treatment possibilities including: prophylaxis, preparations, surgery and endodontics. You and your entire team will love the system’s versatility and quality.
Stops from 780 km/h to 0 km/h in 1 second.

KaVo Direct Stop Technology (DST) enhances hygiene by preventing retractive suction. Additionally, DST increases treatment safety. The fast stop of the bur will reduce the risk of accidental collisions of the turning bur in your patient’s mouth.

When treating nervous children this will give you peace of mind as you can be sure your handpiece reacts almost as fast as you, if your patient suddenly moves.
Precise access is a matter of angles.

KaVo Innovative Instruments.

When you are treating patients you sometimes experience a shortage of space — especially when working on molar teeth. What you’re looking for is an instrument that will allow you to use the little space you have efficiently. Looking for an instrument with a small head seems to be the logical choice. And you will find KaVo instruments with mini heads in all segments — both in the field of air and electric handpieces.

But take a closer look: There is another big factor that will determine how easily you can access all areas in your patient’s mouth: the angles! Several KaVo instruments — including the MASTERmatic M25 L, the MASTERtorque M9000 L and the EXPERTtorque E680 L — come with the KaVo-patented 100°/19° head-knee-angle. A combination that will improve treatment comfort. No matter how small the space.
Reduced noise and vibration. Increased comfort and control.

Innovative Instruments.

At its best, a visit to a dental clinic should be comparable with a visit to a spa — an enjoyable, relaxing moment that leaves a smile on your face. KaVo as a dental manufacturer pursues this challenge and its decades of quality workmanship have introduced a number of features contributing to a pleasant patient experience.

Noise reduction is one of the newest features within KaVo instrument series: Triple-Gear technology enables quiet operation (55 dB(A)) without bothersome vibrations, which makes it comfortable both for the patient and the dental staff.
