Properly cleaning your KaVo NOMAD Pro 2 is very important. Not only does it keep you, your staff, and your patients safe from the spread of viruses, bacteria, and fungi, but it also helps to protect your handheld X-ray device from damage.

It is recommended to disinfect the exterior surface of the NOMAD and handset in between each patient.

**Step 1**
Select an appropriate disinfectant. We recommend using CaviCide™ or CaviWipes™. This line of intermediate-level disinfectants is effective against cross-contamination yet gentle enough to use on diagnostic equipment.

*Note: The chemical combinations of some cleaners can deteriorate the NOMAD plastic prematurely. Contact KaVo with questions on your cleaner.*

**Step 2**
Take a pre-saturated CaviWipe towelette or spray CaviCide solution onto a towel. Do not spray disinfectant or cleaner directly onto the NOMAD, battery handset, charging cradle, or AC power supply.

**Step 3**
Gently wipe down the exterior of the NOMAD and handset. Make certain that the towel is not oversaturated to ensure that moisture does not seep into the NOMAD and damage the electronics.

**Optional**
If you wish, you may place an anti-contamination bag over the device, for each patient use.

**Did you know?**
Due to its dual shielding features, KaVo NOMAD Pro 2 creates a safe zone for the operator, which protects the clinician from backscatter radiation. For more on safety, read the safety information flyer or watch the safety training video.
