HD7B HOLDOWN

Model: HD7B
Anchor Diameter: 7/8"

Maximum Allowable Tension (lbs.):

HD7B Installation
U.S. Patents 6,006,487 and 6,327,831

The HD7B holdown provides a tension connection between a wood-framed wall and the foundation. It installs on the wood member with machine bolts and is connected to the foundation with either a cast-in-place anchor bolt, adhesive anchor or mechanical anchor. The allowable loads shown above are the maximum published for this connector. Allowable loads for HDB holdowns may be limited by the size and species of the wood post. For additional load information see the current Simpson Strong-Tie Wood Construction Connectors catalog.

Anchorage Options
(See pages 6–11 for detailed anchor information.)

Adhesive Anchors
- SET high-strength epoxy anchoring adhesive for use with threaded rod
- AT high-strength, all-weather acrylic anchoring adhesive for use with threaded rod

Mechanical Anchors
- There is no mechanical-anchor solution for this connector

Cast-in-Place Anchors
- SB anchor bolt for high performance in near-edge conditions
- SSTB anchor bolt for high performance in near-edge conditions

How to use these pages:
Steps to select a concrete anchor solution for this connector:
1. Identify the table for your foundation type (slab, stemwall or brick ledge).
2. Using the figures below the table, determine the edge distance condition for the anchor.
3. Based on the species of the wood post, DF/SP = Douglas Fir-Larch or Southern Pine, SPF/HF = Spruce-Pine-Fir or Hem Fir, select the anchor solution from the table.

If no solution is provided, it may not be possible to design anchorage for the maximum capacity of the connector. See pages 6-11 for the allowable loads of concrete anchoring products when evaluating loading conditions below the maximum allowable load for this connector.
