Everything You Need in One Place
We have brought all of our information and training on building stronger, safer decks together in one location to make learning easier than ever.

A Word About Building Codes
This guide recommends connectors and fasteners for deck construction that may meet the requirements of the 2015/2018 International Building Code® and the 2015/2018 International Residential Code®. The information contained here is a summary of the requirements of these codes as they pertain to the connections highlighted in this guide. The building codes contain other requirements regarding aspects of deck construction that are not addressed here; check the codes for details. Check with your local building department to verify what building codes have been adopted in your area.

Limited Warranty
For information regarding the Simpson Strong-Tie Limited Warranty, see strongtie.com/limited-warranties or call (800) 999-5099.

Resources to Make Building Easier
Deck Planner Application, strongtie.com/deckplanner — deck design software
Fastener Finder Application, strongtie.com/ff — fastener identification software
Fastener Designer Application, strongtie.com — fastener load and application mapping software

Product Approvals
Selection of products based upon performance and/or suitability for a specific application should be made by a qualified professional. Simpson Strong-Tie recommends that deck designs be approved by the local building department before construction begins.

International Building Code and International Residential Code are registered trademarks of their respective organizations.
Build a Safe, Strong Deck
Introduction

Build a Safe, Strong Deck

A beautiful deck is about more than wood, fasteners and connectors. It’s about the experiences and connections that happen between people while they are enjoying their time outside. Outdoor living can enhance our enjoyment of life immeasurably, and a well-built deck can make an important contribution to that aspect of our lifestyle. Simpson Strong-Tie believes that a beautiful deck must also be safe and strong.

Deck Construction and Fastening Tips

• Before beginning construction, allow your decking materials to acclimate to the jobsite conditions. A freshly pressure treated deck board can contain over a gallon of liquid.
• Select the proper fastener based on the importance of the connection, exposure, and the materials that are being fastened. Consult pp. 44–46 and pp. 48–50 of this catalog or strongtie.com for guidelines on choosing the correct fastener.
• Consider using 300 Series stainless-steel fasteners when elevated exposure conditions may exist, such as presence of de-icing salts or close proximity to swimming pools, hot tubs, sprinklers, ponds, foliage and other moisture sources. For composite decking, follow manufacturer’s fastening requirements.
• Inadequate gap spacing between boards can put additional load on the fasteners and lead to broken screws or nail pops. For deck board spacing recommendations, refer to the board manufacturer. Spacing for wood decks depends on wood species and moisture content; for composites, consult manufacturer installation instructions.
• Use caution to avoid overdriving fasteners during installation. Overdriving can cause fastener breakage and create a counterbore where water can pool, facilitating corrosion and decay.
• Allow for proper water drainage. A deck should angle away from the structure a minimum of \(\frac{1}{8}\)" for every 8’ to reduce the possibility of standing water.
• If \(\frac{5}{4}\)" decking is to be installed diagonally, reduce the on-center joist spacing to 12" as opposed to the standard 16".
• Adequate ventilation is necessary to minimize cupping, warping and other weathering related defects. Construct the deck a minimum of 18" off the ground to allow proper airflow. If this is not possible, reduce on-center joist spacing to 12" as opposed to the standard 16". A moisture barrier (landscape fabric) under the deck, covered with gravel is also a good practice.
• Proper maintenance is essential. Staining and sealing, along with periodic inspection of fasteners and hardware, will potentially add years to the life of the deck.
• Please refer to the American Wood Council’s Prescriptive Residential Wood Deck Construction Guide (DCA 6) for important information on best practices and code compliant design.
Introduction

Continuous Load Path
As with your home, your deck should be built using a “continuous load path.” The continuous load path is an engineering concept that, when constructed, assures loads are completely transferred from point of application to the foundation via the structural components and connections. The load path or forces from gravity (vertical), lateral (horizontal) and uplift loads effectively transfer the weight (load) from the deck through its frame and then to the foundation and the adjacent support structure (typically your home). If your deck is built with a continuous load path, it will be better equipped to resist forces, such as occupancy, wind, snow and earthquakes. Visit strongtie.com/deckcenter to learn more about achieving a continuous load path in the construction of your deck.

A safe deck is built with fasteners and connectors that create a continuous load path.
Do Decks Really Need to Meet Building Code Requirements?

Because decks may look relatively simple to build, many people do not realize that they are structures that need to be designed to meet minimum standards and resist certain loads. Like a house, or any other building, a deck must be designed to support the weight of people and objects placed on it, as well as lateral and uplift loads that can act on the deck as a result of occupant movement, wind or seismic activity. The 2015/2018 versions of both the IBC and IRC contain language outlining the general design requirements of structures. This excerpt from the 2015/2018 IRC (Section R301.1) represents a summary of the intent of both codes:

“The construction of buildings and structures in accordance with the provisions of this code shall result in a system that provides a complete load path that meets the requirements for the transfer of loads from their point of origin through the load-resisting elements to the foundation.”

The concept of a complete or continuous load path refers to a series of solid connections and structural members within the deck that transfer load to the ground or adjacent supporting structure (commonly a building). This same principle is applied to the design of all types of wood-frame buildings. This continuous load path is created by using a system of structural connectors and fasteners to connect the wood members together.
Common Building Code Violations
The following code requirements can be easily overlooked in deck construction:

1. **Proper fastening of the ledger connection**
   IRC and IBC code prohibits the “use of toenails or nails subject to withdrawal” when making ledger connections, yet a number of deck failures each year result due to using these or other types of improper fasteners. For more information, see p. 22.

2. **Proper fastening of guard posts to the deck**
   IRC and IBC code requires the guard post to resist a 200-pound design load. This load, applied at the top of the guard post, creates a large leverage force where the guard post attaches to the deck framing. For more information, see p. 30.

3. **Post-base connections**
   IRC and IBC code requires posts “be restrained to prevent lateral displacement at the bottom end.” This requirement is important because most decks cannot safely support part or all of their load if a post base can move. For more information, see pp. 17-19.

4. **Openings in guards and stair railings**
   IRC and IBC code places a limit on the size of openings, for the occupants’ safety in case of tripping or falling, and for the safety of small children. For more information, see p. 35.

5. **Lateral load solutions**
   IRC and IBC code requires that a deck be designed for both the vertical and lateral loads. Although there is some lateral movement with wind and seismic events, deck failures occur when people move around on a deck and create that lateral movement causing the deck to pull away from the primary structure before collapsing. For more information, see p. 25.
To build a safe, building code-compliant deck, it’s essential that the deck design establish a continuous load path using a system of key connections throughout the deck framing. When this system of connections is made properly, loads are transferred through the deck frame and into the ground and/or the adjacent structure to which the deck is connected.

The connections shown below are necessary in order to create an effective continuous load path.

For information on the inspection of existing decks, see p. 10. For more information, please refer to the Deck Inspection for New and Existing Construction online training course at strongtie.com/training.

Use the diagram below to determine which deck connections may need retrofitting. For ledger connections to concrete and/or brick, see pp. 23–24.
Do I Need to Retrofit?

Retrofitting an Existing Deck
It’s estimated that of the approximately 50 million existing decks, only half are code compliant. Experts believe that many of these decks are potentially unsafe. In situations where it’s not feasible to rebuild an existing deck, it may be preferable to retrofit it by applying hardware to existing framing members. Many of the products shown in this guide may be installed after deck framing is in place and can improve the safety of the structure and help bring it within the requirements of the code.

Life Expectancy of Decks
Most experts agree that the average life expectancy of a deck is 10 to 20 years. Decks are exposed to the elements, which can cause deterioration. It’s important that decks are properly inspected and maintained on a routine basis. If you are unsure what to inspect for or how often, it’s best to consult with a qualified professional, such as a structural engineer, architect, home inspector or contractor, in order to make sure the deck is safe.

Five Things to Look for on an Existing Deck
It is recommended that you inspect your deck annually for issues that need to be addressed. It’s best to do this prior to seasons when you use your deck most. When inspecting a deck to determine overall safety and compliance with building codes, look at the five areas below. Use this checklist to help ensure a thorough evaluation.

1. Improper Connections
Any connections that do not meet the requirements discussed in this guide can compromise the safety of the deck. In many cases, toenailing (i.e., joining two wood members with angled nailing) does not constitute a proper connection. Connectors must be installed with the correct fastener.

2. Loose Connections
Vital connections may have degraded over time. Wobbly railings, loose stairs and ledgers that appear to be pulling away from the adjacent structure are all causes for concern.

3. Corrosion
Metal connectors and fasteners can corrode over time, especially if a product with insufficient corrosion resistance was originally installed. See pp. 49–50 for more information on corrosion.

4. Decay
Wood can decay with exposure to the elements. Deck framing members that have decayed may no longer be able to perform the function for which they were intended.

5. Splitting
As wood ages, it is common for splitting to develop. Large cracks or excessive splitting can weaken deck framing members.
Existing Decks: Retrofit or Replace?

Connector Solutions for Retrofitting

The following connectors are some of the products that may be suitable for deck retrofit. Selection of products based upon performance and/or suitability for a specific application should be made by a qualified professional. Simpson Strong-Tie recommends that deck designs be approved by the local building department before work begins.

**LCE/AC Post Caps**
Two-piece cap may be installed before or after lumber is in place.

**RPBZ Retrofit Post Base**
Reinforcement for post applications.

**DJTZ**
Connects beams at the side of the post.
(available in ZMAX® coating or in stainless steel)

**LUS Joist Hanger**
Provides bearing and uplift resistance, features double-shear nailing for added strength.

**DTT1Z Deck Tension Tie**
Lateral connections into wall plates, header or studs.
(siding not shown for clarity)

**H1 Hurricane Tie**
Attaches to both sides of the joist.

**DTT2 Deck Tension Tie**
Horizontal application fastening guard post to deck framing.
(available in ZMAX coating or in stainless steel)
Help for Your Deck Planning
Deck Planner Software™

Deck-design software provides a user-friendly means of planning, designing and visualizing new deck construction, as well as deck-remodeled projects.

Simpson Strong-Tie® Deck Planner Software helps you quickly design a custom deck, whether for retrofits or a new build. Once the design is completed, the tool dynamically generates permit submittal pages and a project materials list.

Deck Planner Software allows for the design of decks with fast and powerful editing tools:

- Design in 2D or 3D environments
- Use the deck-shaping tools to insert specific deck dimensions
- Select from different wood species for your framing lumber

The software can also generate full deck plans, specifications and a bill of materials.
Fastener Software

Select with Fastener Designer
Fastener Designer is a web-based application that helps you find alternatives to the specified fasteners in your plans, giving you more design flexibility. This application quickly finds alternatives to standard NDS fasteners for six common applications:

- Withdrawal loading
- Lateral load parallel to grain
- Lateral load perpendicular to grain
- Multi-ply
- Ledger connections
- Sole plate to rim board

Results come with detailed load calculations for both the NDS fastener and the recommended Simpson Strong-Tie structural screw. See strongtie.com/fastenerdesigner for more info.

Search with Fastener Finder
Quickly search our wide array of fasteners to find exactly what you need. Search by multiple criteria, such as application, fastener type, finish/material and model number. Explore our extensive product line in seconds in order to compare, specify or buy. Find the right fastener now by accessing our online Fastener Finder. Visit our website at strongtie.com/ff.
Deck Solutions That Meet Code
Footings

Building Code Requirements

Footings
1. Shall be a minimum 12” x 12” or equivalent (14” round).
2. 12” below undisturbed ground.
3. Footing closer than 5’ to an exterior house wall must bear at the same elevation as the existing house foundation footing (DCA 6).
4. Shall be below the frost depth for the region and not bear on frozen soil unless the frozen condition is permanent.
5. Support the live and dead loads properly.
6. Resist the lateral and net induced uplift forces (wind, seismic, occupant, flood loads).

See 2018-IRC, Table R507.3.1 for deck footing sizes based on tributary area and load bearing value of the soil.

IRC: 2018-R507.3
IRC: 2000-2018-R403.1.1 (Size), R403.1.4 (Minimum depth), R403.1.4.1 (Frost depth)
IBC: 1809.4, Table 1809.7 (minimum size and depth), 1809.5 (Frost protection)

Note: In order to achieve published load values, footings must provide sufficient concrete cover of the embedded portion of Simpson Strong-Tie® cast-in-place post and column bases. In some cases, a footing larger than the minimum required by the building codes will be necessary to meet these requirements. See the Simpson Strong-Tie Wood Construction Connectors catalog for more information.

In order for posts to properly resist various types of loads, they must be supported by, and anchored to, concrete footings. Thin concrete slabs and precast concrete piers do not qualify as proper footings for decks attached to the structure.
Post Bases Installed on Existing Concrete

Posts must be properly attached to a concrete footing in order to resist lateral and uplift loads. Preservative-treated wood that is cut must be field treated or the post must be elevated off the concrete by 1”.

Simpson Strong-Tie® Solutions

Cast-in-Place
These products are cast into the concrete at the time of the pour.

- **CBSQ Column Base**
  Installs with Strong-Drive® SDS wood screws and features a 1” standoff. Hot-dip galvanized coating recommended.

- **PPBZ Porch Post Base**
  Features a 1” standoff. (available in ZMAX coating)

- **PBS Post Base with Standoff**
  Features a 1” standoff. ZMAX or hot-dip galvanized coating recommended.

- **MPBZ Moment Post Base**
  Provides moment resistance for wooden columns or posts in free-standing structures. Features 1” standoff tabs.

A 1” standoff at the base of the post is required when building with wood that is not preservative treated or decay resistant. The standoff plate raises the post end off the concrete, keeping it drier and reducing the chances of decay. For best long-term results, Simpson Strong-Tie recommends that a base with a standoff be used in exterior/wet applications.

*May eliminate bracing, contact design professional for additional information.

Building Code Requirements

Load Resistance
- Columns shall be restrained to prevent lateral displacement at the bottom end. Such lateral restraint shall be provided by manufactured connectors installed in accordance with section R507 and the manufacturer’s requirements, or a minimum post embedment of 12 inches in surrounding soils or concrete piers. Wood columns shall not be less in nominal size than 4’’ x 4’’.
  - 2015 IRC Section R407.3 and R507.8.1
  - 2015 IBC Section 2304.10.7
  - 2018 IRC Section R407.3 and R507.4
  - 2018 IBC Section 2304.10.7
- Column and post-end connections shall be fastened to resist lateral and net induced uplift forces.
  - 2015 IRC Section R502.9
  - 2015 IBC Section 2304.10.7
  - 2018 IRC Section R502.9
  - 2018 IBC Section 2304.10.7
Post Bases Installed on Existing Concrete

Simpson Strong-Tie® Solutions

Post Bases with Anchors
These products utilize anchors installed during the pour or after the concrete hardens.

Building Code Requirements

Load Resistance
- Columns shall be restrained to prevent lateral displacement at the bottom end. Such lateral restraint shall be provided by manufactured connectors installed in accordance with section R507 and the manufacturer’s requirements, or a minimum post embedment of 12 inches in surrounding soils or concrete piers. Wood columns shall not be less in nominal size than 4" x 4".
  
  IRC 2015 Section R507.8.1
  IRC 2018 Section R507.4

- Column and post-end connections shall be fastened to resist lateral and net induced uplift forces.
  
  2015 IRC Section R502.9
  2015 IBC Section 2304.10.7

  2018 IRC Section R502.9
  2018 IBC Section 2304.10.7

PB Post Base
For use with decay-resistant or preservative-treated wood. ZMAX® or hot-dip galvanized coating recommended.

Outdoor Accents®
APB Post Base
ZMAX® with black powder coating.

ABU Adjustable Post Base with Standoff
(available in ZMAX® coating)

CPTSS/CPTZ Concealed Post Tie
(available in ZMAX coating and stainless steel)

ABW Adjustable Post Base with Standoff
(available in ZMAX® coating)

RPB with CPS — Composite Plastic Standoff
(available in ZMAX® coating)
Post Bases Installed on Existing Concrete

Post-Installed Anchors
Installing a post base on existing concrete requires the installation of a post-installed anchor to attach the base to the concrete. Simpson Strong-Tie offers a variety of mechanical anchors and anchoring adhesives that are code listed for structural applications.

Mechanical Anchors:
**Stainless-Steel Titen HD® Screw Anchor**
Provides fast and efficient installation, combined with long-lasting corrosion resistance.
- Available in both Type 316 and Type 304 stainless steel
- For use in cracked and uncracked concrete and masonry
- For use in exterior and most corrosive environments
- Available in 3/16", 1/4", 5/32" and 11/32" diameters and multiple lengths (3" to 81/2")
- Serrated carbon-steel threads at the cutting tip, minimizing potential corrosion damage to the concrete or masonry

For more information on anchoring to concrete, go to strongtie.com or refer to the following literature:
- Anchoring ZMAX® post bases with the stainless-steel Titen HD, see L-PBTHDSS.
- Deck ledger to concrete wall connections, see L-A-THDSSLDGR.
- Deck ledger to masonry wall connections, see L-A-LDGRGFCMU.

Anchoring Adhesives
Anchoring adhesives are ideal when maximum strength is needed. These products are available in a variety of cartridge sizes, including convenient single-tube cartridges. Hot-dip galvanized or stainless-steel threaded rod recommended.

**SET-3G™**
High-Strength Epoxy Adhesive
- For threaded rod and rebar
- Install in dry, water-saturated or water-filled holes in base materials with temperatures between 40°F and 100°F
- NSF/ANSI standard 61 approved

**SET-XP™**
High-Strength Epoxy Adhesive
- For threaded rod and rebar
- NSF/ANSI standard 61 approved

**AT-XP™**
High-Strength, Fast-Cure, All-Weather Acrylic Adhesive
- For threaded rod and rebar
- Can be used in cold temperatures as low as 0°F
- NSF/ANSI standard 61 approved

For more information on these products, see the Simpson Strong-Tie Anchoring and Fastening Systems for Concrete and Masonry catalog or visit strontie.com/anchors.
Beam-to-Post Assemblies and Connections

Building Code Requirements

- Deck beams shall be fastened together with two rows of 10d (0.128” x 3”) box nails minimum at 16” o.c. along each edge.
  
  IBC 2018 Section 2304.10.1
  IRC 2018 Section R507.5

- Deck beams shall be attached to deck posts in accordance with Figure R507.7.1 or by other equivalent means capable to resist lateral displacement.
  
  IRC 2015 Section R507.7.1
  IRC 2018 Section R507.5.2

Beam-to-Post Connections

At the point where a beam meets a post, it must be properly connected to the post in order to resist gravity, lateral and uplift loads. This pertains to solid sawn beams or those comprised of multiple members, whether they rest on top or are fastened to the side of the post.

Multi-Ply Beam Assemblies

For multi-ply beam assemblies, the Strong-Tie® SDWS Framing screw can be used as an alternative to 10d (0.128” x 3”) box nails, when installed in the following configuration.

---

Simpson Strong-Tie® Solutions

BC/BCS Post Cap
For single-member solid sawn beams. Connects double 2x’s to a 4x post or triple 2x’s to a 6x post. ZMAX® coating or stainless steel recommended.

LCE/AC Post Caps
Two-piece cap may be installed before or after lumber is in place when the sides of the post and beam are flush. ZMAX coating or stainless steel recommended.

DJT Deck Joist Tie and Outdoor Accents® APDJT2-6
Deck Joist Tie ZMAX (APDJT with black powder coat).
Beam-to-Post Assemblies and Connections

Simpson Strong-Tie® Solutions

LPC Post Cap
Two-piece cap adjusts for beams smaller than post width. Features a ZMAX® coating.

PCZ/EPCZ Post Caps
Connects beams at the top of the post. Features ZMAX coating. Installation without shims, similar.

CBTZ Concealed Beam Tie
Provides clean look for beam-to-post connections. ZMAX coating.

CCQ Beam-to-Post Connections
Provides a strong connection for column-beam combinations. (Gray paint, also available in HDG and stainless steel)

The following are alternative connections for select beam-to-post assemblies.

Beam-to-Post Connection

Beam-to-Notched Post, Spliced
Uses Strong-Drive® SDWS Timber or Timber SS screws*

Beam-to-Notched Post, Non-Spliced
Uses Strong-Tie SDWS Timber or Timber SS screws*

Continuous Beam over Post
Uses Strong-Drive SDWS Timber Screws.

Mitered Beam over Corner Post
Uses Strong-Drive SDWS Timber Screws.

KBS1Z
Connects diagonal bracing to beams and columns. ZMAX coating. (If using an MPB, diagonal bracing may not be necessary. Contact a design professional for additional information.)

Alternative Diagonal Bracing
Uses Strong-Drive SDWS Timber or SDWS Timber SS screws*

Building Code Requirements

- Deck beams shall be fastened together with two rows of 10d (0.128” x 3”) box nails minimum at 16” o.c. along each edge.
  IRC 2018 Section R507.5
  IRC 2015 Section R507.6
  IRC 2018 Table 2304.10.1

- Deck beams shall be attached to deck posts in accordance with Figures R507.5.1(1) and R507.5.1(2)-2018 R507.7.1-2015 or by other means capable to resist (horizontal-in 2018, only)/ lateral displacement.
  IRC 2015 Section R507.7.1
  IRC 2018 R507.5.1(1) and R707.5.1(2), R507.5.2

- Where posts and beam or girder construction is used to support floor framing, positive connections shall be provided to ensure against uplift and lateral displacement.
  IRC 2015/2018 Section R502.9
  IBC 2015/2018 Section 2304.10.7

*For more information, see engineering letter L-F-DCA6SCREW.
**Vertical Ledger Support at Home’s Band Joist**

One of the most common causes for deck failure is ledgers that pull away from the primary structure, resulting in complete collapse.

The Simpson Strong-Tie® Strong-Drive® SDWS Timber, SDWS Timber SS and SDWH Timber-Hex structural wood screws provide an easy-to-install, high-strength alternative to lag screws and through-bolts. They are ideal for securely attaching ledgers to structural wood members, are easier to drive than comparable fasteners and are available in stainless steel or coated for many exterior and preservative-treated wood applications.

---

**Building Code Requirements**

- Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal.
  
  *IRC 2015/2018 Section R507.1
  *IBC 2015/2018 Section 1604.8.3*

- Deck ledgers shall not be supported on stone or masonry veneer.
  
  *IRC 2015/2018 Section R507.2.1*

- ½” lag screws and ½” bolts may be used for a ledger to band joist, to support a live or snow load of 40 psf or less and a dead load of 10 psf.
  
  *IRC 2015/2018 Table R507.2*

- Deck ledger connections to band joists shall be in accordance with this section. For other grades, species, connection details and loading conditions, deck ledger connections shall be designed in accordance with IRC Section R301.
  
  *IRC 2015 Section R507.2*

- Vertical and lateral supports at band joist. Vertical and lateral support for decks shall follow this section.
  
  *IRC 2018 Section R507.9*

---

**Strong-Drive Structural Wood Screw**

- **SDWS TIMBER Screw**

- **SDWS TIMBER SS Screw** (stainless steel)

- **SDWH TIMBER-HEX Screw**

- Patented SawTooth™ points, serrated thread and knurled shank reduce installation torque

- Identification on all screw heads

- Low-profile washer head on SDWS provides excellent bearing area and a clean look

- For decks in severe corrosion environments, use the Strong-Drive SDWS Timber SS (page 37) or Strong-Drive SDWH Timber-Hex HDG (page 37)

---

**SDWS/SDWH Screw Spacing Detail**

1½” to 2” from top of ledger and rim board

6” from end of ledger

On-center spacing of SDWS wood

3” minimum row spacing, 6” maximum

1½” to 2” from bottom of ledger and rim board

**Ledger-to-Rim Board Assembly**

For more information on ledger attachment, see Fastening Systems catalog Technical Supplement C-F-2019TECHSUP and flier F-F-SDWSSDWH.
Vertical Ledger Support at Band Joist Through Brick Veneer

**BVLZ Brick Veneer Ledger Connector**

The BVLZ brick veneer ledger connector provides a new code-compliant, tested solution for safely adding a deck to an existing house with masonry veneer exterior. It attaches a wood ledger to the framing through the veneer. This connector kit provides a viable alternative to building a free standing deck, and it installs without having to remove or replace large sections of masonry veneer.

The BVLZ brick veneer ledger connector kit includes a steel ledger plate, a compression strut, installation guide, two 14” Strong-Drive® SDWH Timber-Hex HDG tension screws and six Strong-Drive SD Connector shear screws. It’s designed so the two tension screws pass through the mortar into the structural framing, and the compression strut transfers compression forces from the ledger plate to the rim joist. The system enables the ledger to hang freely without bearing on the brick veneer.

For more information on ledger attachment, see C-C-2019, pp. 290–291 or strongtie.com/bvlz.
Vertical Support at Concrete or CMU

**Titen HD® SS Stainless-Steel Anchor**

The Simpson Strong-Tie® Stainless Steel Titen HD (THDSS) (see p. 19), may be be used to attach a deck ledger to either a concrete or grout-filled concrete masonry unit (GFCMU) wall in accordance with the International Residential Code (IRC). For more information, refer to L-A-THDSSLDGR for concrete walls, and L-A-LDGRGFCMU for GFCMU walls. The anchor is available in either Type 304 or Type 316 stainless steel.

**Ledger-to-Concrete Wall Attachment**

- THDSS screw anchors stagger vertically spaced in accordance with table
- 8" min. from the top of the concrete wall
- Deck ledger
- 6 1/4" min.
- 2" min. from the top of the concrete

**THDSS Screw Anchor Spacing Detail for Ledgers**

- 1 1/4" min. from vertical head joint (typ.)
- 11" min. from top of wall to end anchor
- 11" min. from the top of the ledger (not to exceed 1/2 of table spacing)
- 4" to 8" from the end of the ledger (not to exceed 1/2 of table spacing)

**Ledger-to-GFCMU Wall Attachment (Condition 1)**

- THDSS screw anchors stagger vertically spaced in accordance with table
- 8" min. from the end of the wall
- 8" min. from the end of the ledger
- 4" min. from the top of the GFCMU wall

**Ledger-to-GFCMU Wall Attachment (Condition 2)**

- THDSS screw anchors stagger vertically spaced in accordance with table
- 4" min. from the end of the wall
- 4" min. from the top of the GFCMU wall
- 8" min. grout-filled CMU
Lateral Support at Band Joist

For decks that are partially supported by an adjacent structure (such as a house), the connection between the deck and that structure is vital. A bolted or screwed ledger-to-rimboard connection is suitable to support gravity loads; however, in some cases the building codes require a connection that is able to resist lateral loads. In these situations, tension ties are typically called out to tie the joists of the deck directly to the structure.

DTT deck tension ties are a safe, cost-effective solution designed to meet or exceed lateral-load code requirements for deck construction.

DTT1Z satisfies the 2015/2018 IRC provision for a 750 lb. lateral-load connection to the house at four locations per deck. This code detail permits the lateral connection from the deck joists to be made to top plates, studs or headers within the supporting structure.

DTT2 can be used to satisfy the 2015/2018 IRC provision for a 1,500 lb. lateral-load connection at two locations per deck.

For more information on lateral-load connections, refer to Simpson Strong-Tie technical bulletin T-C-DECKLAT at strongtie.com.
Joists Terminating into Beam/Ledger

When joists terminate into a beam or ledger, a connection is required to provide bearing. The connection must also resist uplift.

Ledger may not be installed over siding or stucco. It must be fastened directly to the rim board, or fastened to the rim board through the sheathing.

Simpson Strong-Tie® Solutions

HUS/LUS Joist Hanger
Provides bearing and uplift resistance, features double-shear nailing for added strength. ZMAX® coating or stainless steel required. (LUS shown)

HUC/LUC Concealed Flange Joist Hanger
Provides bearing and uplift resistance, concealed flanges for cleaner look and end conditions. ZMAX coating or stainless steel required. (LUC shown)

APLH Outdoor Accents® Light Joist Hanger
Provides bearing and uplift resistance, concealed flanges for cleaner look and end conditions. ZMAX with black powder coating. Uses black SD10112DDBB fasteners.

APHH Outdoor Accents Heavy Joist Hanger
Provides bearing and uplift resistance, concealed flanges for cleaner look and end conditions. ZMAX with black powder coating. Uses STN22 washer and SDWS22312DBB fasteners.
Joists Terminating into Beam/Ledger

Building Code Requirements

Bearing
• The ends of each joist, beam or girder shall have at least 1 1/2" of bearing on wood or metal.
  IRC 2018 Section R507.6.1
  IRC 2015 Section R507.7
  IRC 2015/2018 Section R502.6
  IBC 2015/2018 Section 2308.4.2.2

• Joists framing into the side of a ledger board or beam shall be supported by approved joist hangers.
  IRC 2015 Section R507.7
  IRC 2018 Section R507.6.1

Cantilevered Applications
• Decks with cantilevered framing members, connections to exterior walls or other framing members shall be designed and constructed to resist uplift resulting from the full live load acting on the cantilevered portion of the deck.
  IRC 2018 Section R507.8
  IBC 2018 Section 1604.8.3

SUR/SUL Skewed Joist Hanger
45° skewed hanger (available in skewed right and left versions), provides bearing and uplift resistance. ZMAX® coating or stainless steel required.

LSSJ28LZ
LSSR210-2Z
For use with double 2x lumber.

LSSR/LSSJ Field-Skewable Joist Hanger
LSSR field skewable right or left up to 45° (order LSSJ in left or right skews). These hangers provide bearing and uplift resistance. Also field slopeable up or down to 45°. Available with a ZMAX coating.

Typical LSSJRZ Installation
(bievel cut required)
Typical LSSR Installation
(compound miter cut)
Alternate LSSR Installation
(plumb cut)
Joists Bearing on a Beam

Building Code Requirements

• Where posts and beam or girder construction is used to support floor framing, positive connections shall be provided to ensure against uplift and lateral displacement.
  
  IRC 2015/2018 Section R502.9
  IBC 2015/2018 Section 2304.10.7

• Joist ends and bearing locations shall be provided with lateral restraint to prevent rotation.
  
  IRC 2018 Section R507.6.2
  IBC 2018 Section 2308.4.2.3
  IBC 2018 Section 2308.8.2

• Joists bearing on top of a single-ply beam or ledger shall be attached by a mechanical connector. Joists bearing on top of a multiple-ply beam or ledger shall be fastened in accordance with Table R602.3(1).
  
  IRC 2018 Section R507.6.2

At the point where the joist bears on top of a beam, there must be a connection to resist lateral and uplift forces. Blocking or framing is also required to prevent overturning of the joists.

Simpson Strong-Tie® Solutions

HTSQ Twist Strap
Designed to resist uplift for decks and beams. Available in ZMAX® and stainless steel.

H1Z Hurricane Tie
Holds joist on both sides. ZMAX coating recommended.

H2.5A Hurricane Tie
Suitable for single-sided applications. ZMAX coating or stainless steel recommended.

Simpson Strong-Tie offers a full range of hurricane ties for all types of applications and load requirements. See the Simpson Strong-Tie Wood Construction Connectors catalog for more information.
Guard Post to Deck Framing

The guard post connection is a crucial connection pertaining to deck safety, and it is often inadequately constructed. In order to provide the required load resistance at the guard, the post must not only be fastened to the rim joist, but also tied back into the joist framing. Machine bolts through the post and rim joist alone do not typically meet the performance requirements of the code. The details on pp. 29–32 have been shown through testing or analysis to resist the required 200 lb. concentrated load (or load of 50 lb. per linear foot per IBC) applied in an outward direction for maximum guard heights of 36” and 42” above the deck surface.

For more information on this application, see Simpson Strong-Tie technical bulletin T-C-GRDRLPST.
Simpson Strong-Tie® Solutions
For 36”-Tall Guard Posts

Building Code Requirements

When required
• Guards shall be located along open-sided walking surfaces, including stairs, ramps and landings, that are located more than 30” measured vertically to the floor or grade below at any point within 36” horizontally to the edge of the open side.
  IRC 2015/2018 Section R312.1.1
  IBC 2015/2018 Section 1015.2

Height
• Guards shall be a minimum of 36” tall (IRC) or up to 42” tall for certain occupancies (IBC).
  IRC 2015/2018 Section R312.1.2
  IBC 2015/2018 Section 1015.3

Load Resistance
• Guards and handrails shall be able to resist a single concentrated load of 200 lb., applied in any direction at any point along the top.
  IRC 2015/2018 Table R301.5
  IBC 2015/2018 Section 1607.8.1 (one- and two-family dwellings)

• Handrails and guards shall be designed to resist a load of 50 pounds per linear foot.
  IBC 2018 Section 1607.8.1 (not required for one- and two-family dwellings)

DTT2 Deck Tension Tie
(available with ZMAX® coating or in stainless steel)

Note: The DTT2 may also be used to secure 42” guard posts with 2x10 (min.) deck joists.

For more information on connecting posts inside the rim joist using the DTT2 or HTT4, see Simpson Strong-Tie technical bulletin T-C-GRDRLPST.
Guard Post to Deck Framing — Holdown Details

For 42"-Tall (maximum) Guard Posts

Note: The HTT4 may also be used to secure 42" guard posts with 2x10 (min.) deck joists.

For more information on connecting posts inside the rim joist using the DTT2 or HTT4, see Simpson Strong-Tie technical bulletin T-C-GRDRLPST.
For 36"- and 42"-Tall Guard Posts
As an alternative code-compliant solution for attaching wood guard posts without the use of typical hardware and through-bolts, the guard posts and the framing elements can be fastened with Strong-Drive® SDWS Timber screws. The SDWS Timber screws are code report listed in IAPMO UES ER-192. The solutions below have been tested and verified for 36"-tall guard posts constructed with DFL, HF and SP framing. These solutions have also been tested and verified for 42"-tall guard posts constructed with DFL and SP framing only. For more information, please refer to T-F-GRDPSTRL18.

**Strong-Drive SDWS TIMBER Screw**
(5": SDWS22500DB, 8": SDWS22800DB)

**Note:** For this installation, it is imperative that only approved fasteners are used and installed per Simpson Strong-Tie details. Test results have shown that generic fasteners do not provide sufficient withdrawal resistance, pull-through resistance or shear strength.

Plan View Showing Details of Four Connections Using Strong-Drive SDWS Timber Screws
(Other connection hardware not shown for clarity)
Guardrail Installations
Code-Compliant Guardrail Connection Details

Installation scope:
• Maximum guard post spacing of 6’
• Nominal 2x4 top and bottom guardrail (AWC, DCA6)
• Nominal 4x4 guard post, min. specific gravity 0.42; min. guardrail specific gravity 0.36

Code compliant fastener solutions for guardrail-to-post and baluster-to-rail assemblies use Strong-Drive® SDWS Framing screws, Deck-Drive™ DSV Wood screws and Deck-Drive DWP Wood SS screws, as described in this section. For more information, please refer to T-F-GRDPSTRL18.
Building Code Requirements

When required
- Guards shall be located along open-sided walking surfaces, including stairs, ramps and landings, that are located more than 30" measured vertically to the floor or grade below at any point within 36" horizontally to the edge of the open side.
  
  IRC 2015/2018 Section R312.1.1
  IBC 2015/2018 Section 1015.2

Height
- Guards shall be a minimum of 36" tall (IRC) or up to 42" tall for certain occupancies (IBC).
  
  IRC 2015/2018 Section R312.1.2
  IBC 2015/2018 Section 1015.3

Load Resistance
- Guards and handrails shall be able to resist a single concentrated load of 200 lb., applied in any direction at any point along the top.
  
  IRC 2015/2018 Table R301.5
  IBC 2015/2018 Section 1015.3

- Handrails and guards shall be designed to resist a load of 50 pounds per linear foot.
  
  IBC 2018 Section 1607.8.1
  (not required for one- and two-family dwellings)

- Guardrail infill components shall withstand a horizontal load of 50 lb. over an area of 1 square foot.
  
  IRC 2015/2018 Table R301.5

Opening Limitations
- Required guardrail infill shall not have an opening that allows passage of a sphere 4" in diameter.
  
  IRC 2015/2018 Section R312.1.3

Baluster Installations

Code-Compliant Baluster Connection Details

Installation scope:
- Maximum guard post spacing of 6'
- Nominal 2x4 top and bottom guardrail (AWC, DCA6)
- Nominal 4x4 guard post, min. specific gravity 0.42; min. guardrail specific gravity 0.36

For internal guard post installations using Strong-Drive SDWS Timber screws, refer to p. 32.

2x4 top rail (typ.)
2x2 baluster (typ.)
4x4 preservative-treated guard post
2x4 bottom rail (typ.)

Overall Perspective View of Deck with Baluster Detail

1. Fasten screws into 2x2 baluster, on center, 7/8" from each end of baluster into 2x4 top and bottom rails with SDWS16212 screws.

Baluster Perspective View

Detail B: Baluster Elevation View (Side)

(SDWS16212 listed, DSVT212, S08250WP similar)
Stair Stringers and Treads

Stair stringers must be properly connected to the deck, and treads properly connected to the stringers, in order to resist loads. In addition, code requirements regarding openings between stair treads and stair railing must also be met.

Simpson Strong-Tie® Solutions

Stair Stringer to Rim Joist

- Stairs must be able to resist 40 pounds per square foot of tread area in one and two family dwellings. All other stairs under IBC require a design to 100 psf.
  
  IRC 2015/2018 Table R301.5
  IBC 2015/2018 Table 1607.1

Stair Tread to Stringer

- Individual stair treads shall be able to resist a 300 lb. concentrated load acting over an area of 4 square inches.
  
  IRC 2015/2018 Table R301.5
  IBC 2015/2018 Table 1607.1

Guard Opening Limitations

- The triangular opening formed by the riser, tread and bottom rail of a guard at the open side of a stairway shall be of such a size that a sphere 6" in diameter cannot pass through.
  
  IRC 2015/2018 Section R312.1.3
  IBC 2015/2018 Section 1015.4

  Additional IRC Exception: Openings for required guards on the sides of stair treads shall not allow a sphere 4\(\frac{3}{8}\)" in diameter to pass through.
  
  IRC 2015/2018 Section R312.1.3

Building Code Requirements

LSC Adjustable/LSC Cantilever Stair Stringer Connector

Field slopable to almost any angle, the LSC is ideal for attaching the staircase stringer to the deck. Suitable for solid and notched stringers. ZMAX® coating or stainless steel required. For information regarding notched stringer attachment to full-width stringers, see L-F-DCABSCREW.

Codes require that a 4\(\frac{3}{8}\)" sphere must not be able to pass between any guard opening at stairs.

TA Tread Angle

Provides a positive connection, eliminating the need to notch the stringer. A full-width stringer is stronger and makes it easier to meet maximum guardrail opening requirements of the codes. ZMAX coating or stainless steel required.

LSCZ/LSCSS
Performance Fasteners for Decks
Structural Wood Fastening

Structural Wood-to-Wood and Engineered Wood Connections

Simpson Strong-Tie® Strong-Drive® structural screws make high-strength wood-to-wood and engineered wood connections easier and stronger. Designed for both ease of installation and superior strength, these versatile screws are a time-saving alternative to multiple smaller fasteners, lag screws or bolts that require predrilling.

**Strong-Drive SDWS FRAMING, SDWS TIMBER and SDWH TIMBER-HEX Structural Wood Screw**

The Simpson Strong-Tie Strong-Drive SDWS Timber, SDWH Timber-Hex and SDWH Timber-Hex HDG wood screws are designed to provide an easy-to-install, high-strength alternative to through-bolting and traditional lag screws. These structural screws are ideal for the contractor and do-it-yourselfer alike, and are available in materials and coatings for various levels of corrosion resistance to match your installation environment.

**Features:**
- Bold thread design that provides superior holding power
- Quik Guard® Double-barrier coating (SDWS and SDWH) and hot-dip galvanized (SDWH HDG)
- Patented SawTooth™ points that ensure fast starts, reduce installation torque and eliminate the need for predrilling in most applications
- Underhead nibs that offer greater installer control when seating the head
- Large washer head provides maximum bearing area

**Codes/ Standards:** IAPMO UES ER-192

**Strong-Drive SDWS TIMBER SS Screw**

The Strong-Drive SDWS Timber SS heavy-duty structural fastener in severe corrosion–resistant Type 316 stainless steel, has a 0.276"-diameter shank, SawTooth™ point and flat washer head and is designed as a lag screw replacement in applications where severe-corrosion resistance is critical.

**Features:**
- Patented SawTooth point for fast starts and less driving torque — without predrilling
- Large 0.650"-diameter flat washer head with nibs provides load-bearing area and seats flush with surface
- Deep T50, 6-lobe recess for secure driving
- Type 316 stainless steel provides corrosion resistance even in severe conditions
- Mid-shaft knurl aids in torque reduction

**Strong-Drive SDS HEAVY-DUTY CONNECTOR Screw**

The Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screw is a ¼"-diameter high-strength structural screw ideal for various connector installations as well as wood-to-wood and engineered wood applications.

**Features:**
- Available with a double-barrier coating or in Type 316 stainless steel
- Type 17 points enable easy driving with no predrilling and minimal splitting
- Double-barrier coating provides corrosion resistance equivalent to hot-dip galvanization
- Head is stamped with the Simpson Strong-Tie “®” sign and fastener length for easy identification after installation

**Codes/ Standards:** ICC-ES ESR-2236
Corrosion-Resistant Fasteners for Decking

Simpson Strong-Tie offers a variety of premium solutions for fastening wood, PVC or composite decking. Our fasteners are designed specifically to perform in their target decking material, and many of our fasteners are available in colors to provide a fastening solution that blends with the deck surface.

### Stainless-Steel Screws

**Deck-Drive™ DWP WOOD SS Screw**

For the majority of wood deck boards

**Strong-Drive® DWP WOOD SS Screw**

For structural applications on decks

**Bugle-Head Wood Screw**

For all types of wood decking including cedar, redwood and preservative-treated woods (non-hardwood). Bugle-Head Wood screws are available in both square and 6-lobe drive recesses.

**Trim-Head Screw — 6-Lobe Drive**

For wood decking and PVC decking materials

**Deck-Drive DCU COMPOSITE SS Screw**

For composite decking

Also available with color-matching painted heads

**Deck-Drive DHPD HARDWOOD Screw**

For hardwood decking materials

### Exterior-Grade Screws

**Deck-Drive DSV WOOD Screw**

For preservative-treated wood

**Deck-Drive DCU COMPOSITE Screw**

For composite/PVC decking. Available in a variety of color-matching painted options. See p. 41

### Load-Rated Deck Board Fasteners

**Strong-Drive DWP WOOD SS Screw**

Sizes: #12 and #14. For wood in high and severe corrosion environments. For more information, see C-F-2019TECHSUP

**Deck-Drive DCU COMPOSITE Screw**

For composite/PVC decking. For more information, see L-F-DCUUPLIFT

**Deck-Drive DSV WOOD Screw**

Size: #10. For preservative-treated decking applications in medium corrosion environments. For more information, see C-F-DSVLOAD19.

For more information on fasteners, please visit strongtie.com/fastenerfinder.
Stainless-Steel Nails

**Hand-Drive**

**Decking and Trim Nails**

- **15° Wire Coil, Full Round Checkered Head, Ring Shank**
  - Types 304 and 316 Stainless Steel

- **20°–22° Plastic Strip, Full Round Checkered Head, Ring Shank**
  - Types 304 and 316 Stainless Steel

- **20°–22° Plastic Strip, Full Round Smooth Head, Screw Shank**
  - Types 304 and 316 Stainless Steel

- **20°–22° Plastic Strip, Checkered, Casing Head, Ring Shank**
  - Type 304 Stainless Steel

- **28° Wire Weld, Clipped Smooth Head, Ring Shank**
  - Type 304 Stainless Steel

- **31°–34° Plastic Strip, Full Round Checkered Head, Ring Shank**
  - Types 304 and 316 Stainless Steel

- **31°–34° Paper Tape, Clipped Smooth Head, Ring Shank**
  - Types 304 and 316 Stainless Steel

For more information on fasteners, please visit strongtie.com/fastenerfinder.

**Building Code Requirements**

- Wood decking shall be attached to each supporting member with not less than (2) 8d threaded nails or (2) No. 8 wood screws.
  - IRC 2018 Section R507.7

Stainless-steel connectors are also available for high and severe exposure environments or applications using certain preservative-treated woods. See pp. 49–50 for more detail.
Quik Drive® Auto-Feed Screw Driving Systems for Decks

**Building Code Requirements**

- Wood decking shall be attached to each supporting member with not less than (2) 8d threaded nails or (2) No. 8 wood screws.  
  *IRC 2018 Section R507.7*

Experience has shown that #7 stainless steel screws are acceptable for face screw fastening of hardwood and composite deck boards.

**Fastening for composite decking or using concealed fasteners:**

*IRC 2015 R507.3, R507.3.5; IRC 2018 Sections R507.2.2, 507.2.2.5

Wood Plastic Composite deck boards shall be installed in accordance with the manufacturer’s instructions and shall comply with the requirements of ASTM D7032 Section 5.6 Mechanical Fastener Holding Tests for the use of concealed clips. Simpson Strong-Tie recommends consulting with the decking manufacturer for their recommendations.

---

**PROSDD/CCS+ Combo System**

Applications: Decks/docks, subfloor, sheathing, wall plates, stair treads, fiber-cement siding, drywall

- Expanded depth settings for high-density materials
- Reversible and replaceable non-skid teeth
- Uniform toenailing and countersink on slick surfaces
- Two screw driving attachments for added versatility

**Deck-Drive™ DSV WOOD Screw**

Rimmed flat head with nibs, Quik Guard® coating in red, tan and gray

**Deck-Drive DHPD HARDWOOD Screw**

Paddle-style drill point, Type 305 stainless steel

**Deck-Drive DWP WOOD SS Screw**

Flat head with nibs, available in Types 305 and 316 stainless steel

**Trim-Head Screw**

#7 trim head, Type 305 stainless steel

**Deck-Drive DCU COMPOSITE Screw**

Available with Quik Guard coating in 11 colors or in Types 305 and 316 stainless steel. DCU Composite screws are load rated for uplift resistance. See L-F-DCUULIFT18.

**Bugle-Head Wood Screw**

#10 bugle head, available in Types 305 and 316 stainless steel

**PRO300S System**

Applications: Decks/docks, subfloor, wall plates, stair treads

- Expanded depth settings for high-density materials
- Reversible and replaceable non-skid teeth
- Includes a decking nose clip to position decking screws quickly and precisely every time
- Uniform toenailing and countersink on slick surfaces
- Sure-grip guide tube increases stability for a broad range of screws

F-DECKCODE20 © 2020 Simpson Strong-Tie Company Inc.
Decking Meets Its Match

Simpson Strong-Tie® color-matched hand-drive and collated fasteners are available in a color palette specifically formulated to match a wide range of the most popular decking systems, and are designed to blend into the decking material.

Trim-Head PVC Decking: Azek, Cevn, Gossen, Timber Tech, Trex, Veka Deck
Composite or Encapsulated Decking: ChoiceDek, Evergrain, Fiberon, Moisture Shield, Timber Tech, Trex

For more information on Simpson Strong-Tie color-match fasteners, please refer to strongtie.com/colormatchingguide.

AZEK, Cevn, ChoiceDek, Evergrain, Fiberon, Gossen, MoistureShield, TimberTech and VekaDeck are trademarks or registered trademarks of their respective holders. Trex and Trex Escapes are registered trademarks of Trex Company, Inc.

Composite or Encapsulated Composite Decking

Deck-Drive™ DCU COMPOSITE Screw
- Cap head to reduce mushrooming and conceal installation
- Available in colors to match popular composite deck boards
- Available with Quik Guard® coating and stainless steel
- For more information, see C-F-2019 Fastening Systems catalog

PVC Decking Fasteners

Trim-Head Screw, Stainless Steel, 6-Lobe Drive
- Trim-style head reduces appearance of installed fasteners on deck surface
- Available in colors formulated to match popular PVC deck systems

PVC and Composite Fascia Fastening

Fascia-Fastening Solution
To properly install color-matched fasteners into a PVC fascia board, proper fastener spacing and counter-boring is necessary. The Fascia-Fastening Solution provides the means to accomplish this for a professional finish

- Type 316 stainless steel, color-matching fasteners for ½”-¾” thick fascia boards
- Installs easily with the Fascia Counterbore bit and T20 6-lobe bit

Deck-Drive™ DCU Screw Plugs
Deck-Drive DCU screw plugs provide a means of concealing the Deck-Drive DCU Composite screw heads used to fasten PVC and composite deck boards. The DCU screw plug solution can be ordered to color-match the deck boards, and comes with countersinking driver bits for hand drive, as well as for Quik Drive® auto-feed screw driving systems.

- For PVC and Composite decks and trim boards
- Made from major manufacturer deck and trim boards

Deck-Drive DCU Composite screws are approved by Trex for Trex 1” x 6” and 2” x 6” composite decking.

Building Code Requirements

- Wood decking shall be attached to each supporting member with not less than (2) 8d threaded nails or (2) No. 8 wood screws.
- Wood Plastic Composite deck boards shall be installed in accordance with the manufacturer’s instructions and shall comply with the requirements of ASTM D7032 and this section.

IRC 2018 Section R507.7
2015 Section R507.3, R507.3.5
2018 Section R507.2.2, R507.2.2.5

Experience has shown that #7 stainless steel screws are acceptable for face screw fastening of wood and composite deck boards.

Fastening for composite decking or using concealed fasteners:

- IRC 2015 R507.3, R507.3.5
- IRC 2018 Sections R507.2.2, R507.2.2.5

Stainless-steel connectors are also available for high and severe exposure environments or applications using certain preservative-treated woods. See pp. 49-50 for more detail.
EB-TY® Premium Hidden-Deck Fastening System™

For wood decks including exotic hardwoods, redwood and cedar

The EB-TY Premium Hidden Deck-Fastening System is the ideal solution that blends strength with ease of installation in a fastener that won’t detract from the deck’s finished appearance. EB-TY Premium integrates a Type 300 series stainless-steel reinforcing plate into its connection biscuit. The plate adds stiffness to hold boards in place securely, yet maintains flexibility when seasonal contraction and expansion occur. The EB-GUIDE predrilling tool helps install EB-TY Premium with precision and ease. Ipê wood plugs included.

Features:
- Provides greater holding power and increased pullover resistance
- Type 300 series stainless-steel plate ensures lasting durability in demanding environments
- Prevents over-driving of the screw, helping to ensure consistent, quality installations
- Angled screw attachment ensures direct attachment of the board to the joist and prevents board movement
- EB-TY Premium covers the joist to protect it from exposure to sun and rain
- Chamfered edges for easier board alignment and installation of successive boards
- 3/16” and 1/4” spacings offer expansion compensation
- Additional Ipê Wood Plugs can be purchased separately

Fastener Selection Guidance
Matching Connectors and Fasteners

Guidelines for Selecting Materials and Coatings

The following pages provide a system for determining which connector and fastener product coatings and base metals to use in a range of corrosion conditions. These are general guidelines that may not consider all relevant application criteria. Also refer to pp. 48-50 and product-specific information for additional guidance.

The Right Connectors and Fasteners for Your Environment

**Step 1** Choose connectors with the right material/finish for your environment.

<table>
<thead>
<tr>
<th>Connector Corrosion Resistance</th>
<th>Product Coating/Material</th>
<th>Dry Environment</th>
<th>Wet Environment</th>
<th>Coastal Environment</th>
</tr>
</thead>

**Corrosion Environment Types**

- **Dry Service** Interior applications such as inside wall and ceiling cavities, attics and raised-floor applications in enclosed buildings.
- **Wet Service** Exterior applications such as decks, pergolas, covered patios, fences and other structures where connectors or fasteners will get wet due to rain, snow, sprinklers and other condensation. (For coastal or poolside areas, see below.)
- **Coastal/Water Front Service** Marine environments that include airborne chlorides, salt air and some salt splash. Environments with de-icing salts are included.

- For applications involving ACZA preservative-treated or fire-resistant lumber, use a material or coating in the medium-resistance category.
- For applications where the service environment is uncertain, or corrosion potential is elevated by the presence of fumes, fertilizers, chlorine, soil, some preservative-treated wood, acid rain, salt air and other chemicals and corrosive elements, stainless steel is recommended.
- Wet service includes wood with preservative treatments as described by AWPA for Exterior Protected and Exposed (UC3A and UC3B) and General Use Ground Contact (UC4A).

**Step 2** Choose the fastener material/coating that matches your connector.

**Remember** Always use the correct type, diameter and length of fastener that is specified for the connector. For more information, visit strongtie.com.
Many Simpson Strong-Tie connectors have been designed and tested for use with specific types and sizes of fasteners. The specified quantity, type and size of fastener must be installed in the correct holes on the connector to achieve published loads. Other factors such as fastener material and finish are also important. Incorrect fastener selection or installation can compromise connector performance and could lead to failure. For more information about fasteners, see our Fastening Systems catalog at strongtie.com or access our Fastener Finder software at strongtie.com/software.

The Simpson Strong-Tie® Strong-Drive® SD Connector screw is the only screw approved for use with our connectors. Consult the current Simpson Strong-Tie Wood Construction Connectors catalog for complete fastener and fastening requirements.

The allowable loads of stainless-steel connectors match those of carbon-steel connectors when installed with Simpson Strong-Tie® stainless-steel, SCNR ring-shank nails. For more information, refer to C-F-2019TECHSUP page 135 at strongtie.com.
Fastener Information

Fastening Identification

- **Round Holes**
  - Purpose: To fasten a connector.
  - Fill Requirements: Always fill, unless noted otherwise.

- **Oround Holes**
  - Purpose: To make fastening a connector in a tight location easier.
  - Fill Requirements: Always fill, unless noted otherwise.

- **Hexagonal Holes**
  - Purpose: To fasten a connector to concrete or masonry.
  - Fill Requirements: Always fill when fastening a connector to concrete or masonry.

- **Triangular Holes**
  - Purpose: To increase a connector’s strength or to achieve max. strength.
  - Fill Requirements: When the designer specifies maximum nailing.

- **Diamond Holes**
  - Purpose: To temporarily fasten a connector to make installing it easier.
  - Fill Requirements: None.

- **Speed Prongs**
  - Used to temporarily position and secure the connector for easier and faster installation.

- **Positive Angle Nailing (PAN)**
  - Provided when wood splitting may occur, and to speed installation.

- **Dome Nailing**
  - This feature guides the nail into the joist and header at a 45° angle.

- **Double-Shear Nailing**
  - The nail is installed into the joist and header, distributing the load through two points on each joist nail for greater strength. Double-shear nailing must be full-length catalog nail.

Incorrect Applications

**Short Nails**
Do not use short (1 1/2”) nails for double-shear nailing.

**Power Nailing**
Collated framing-nailer fasteners can only be used if:
1. Correct diameter and length are installed
2. Correct material or finish is installed
3. Correct quantity is installed
4. Nails are driven with a hole-locating tool (finds the hole) or by hand
5. A full, round concentric head is required

NOTE:
- Nails with 0.131” diameter may not be used to replace 10d common or 16d sinker nails
- Do not overdrive
- Drive only through punched holes

Power-driven nails must meet ASTM A153 Class D or equivalent specification for ZMAX® or hot-dip galvanized applications. As most framing nails are only zinc-plated, please ensure that the nails used with ZMAX connectors are hot-dip galvanized to meet ASTM A153.

Consult the current Simpson Strong-Tie Wood Construction Connectors catalog for complete fastener and fastening requirements.
Mitigating Corrosion Risk
Corrosion Issues

When selecting hardware or fasteners for deck construction, it is important to use connectors and fasteners with a level of corrosion resistance appropriate to the application.

Connectors and fasteners are exposed to the weather and often treatment chemicals in outdoor environments leading to an increased corrosion hazard. If building a deck in an area especially prone to moisture, such as along the coast or near bodies of water, the risk of corrosion is much higher. In addition, the chemicals used in some preservative-treated woods have been found to increase the corrosion of connectors and fasteners. Other corrosion risk factors include exposure to fire retardants, fumes, fertilizers, soil, industrial zones, acid rain and other corrosive elements.

Depending on the deck materials and environmental conditions, Simpson Strong-Tie® ZMAX® coated (G185) and hot-dip galvanized (HDG) connectors and fasteners may provide adequate corrosion resistance. If you choose to use ZMAX or HDG on your deck project, you should periodically inspect your connectors and fasteners or have a professional inspection performed. Regular maintenance including water-proofing of the wood used to construct your deck is also a good practice. When using ZMAX/HDG connectors, you must use fasteners galvanized per ASTM A153, SDS screws with a double-barrier coating, or SD screws with a mechanically galvanized coating.

For high and severe corrosion applications, stainless-steel connectors and fasteners offer the best defense against corrosion. Simpson Strong-Tie offers a variety of connectors and fasteners in stainless steel for deck construction. For more information on corrosion and selecting the appropriate finish for your application, visit strongtie.com/info.

The Science Behind Stainless Steel

Simpson Strong-Tie connectors are available in 316 stainless steel, and Simpson Strong-Tie fasteners are available in either 316 or 304/305 stainless steel. Type 300 Series stainless steels contain chromium that is activated on the surface as chromium oxide and protects the base metal from corrosive attack. Type 316 stainless steel contains molybdeum, which increases corrosion resistance in chloride-containing exposures, such as saltwater environments.

Common Conditions That Can Affect Corrosion Resistance of Metal Connectors and Fasteners

- Ocean salt air
- Water
- Preservative-treated wood
- Fire retardant-treated wood
- Salt used to de-ice or melt snow
- Pool or hot-tub chemicals
- Fertilizers
- Soil
- Industrial zones
- Concrete
- Weather exposure

Always Use Stainless-Steel Fasteners with Stainless-Steel Connectors

Go to strongtie.com for more information regarding stainless-steel fasteners and connectors.

1. Always consider the importance of the connection as well as the cost of maintenance and replacement.
2. If the information about treatment chemicals in an application is incomplete, or if there is any uncertainty as to the service environment of any application, Simpson Strong-Tie recommends the use of a Type 300 Series stainless steel. Simpson Strong-Tie has evaluated the corrosion effects of various formulations of wood treatment chemicals ACZA, ACQ, CCA, MCA, and CA, and salt as corrosion accelerators. Simpson Strong-Tie has not evaluated all formulations and retentions of the named wood treatment chemicals other than to use coatings and materials in the severe category. Manufacturers may independently provide test results or other product information. Simpson Strong-Tie expresses no opinion regarding such information.
3. Type 316/305/304 stainless-steel products are recommended where preservative-treated wood used in ground contact has a chemical retention level greater than those for AWPA UC4A; CA-C, 0.15 pcf; CA-B, 0.21 pcf; micronized CA-C, 0.14 pcf; micronized CA-B, 0.15 pcf; ACQ-Type D (or C), 0.40 pcf. When wood treated with micronized CA-C and micronized CA-B with treatment retentions up to UC4B is in dry service, hot-dip galvanized fasteners and connectors may be suitable.
4. Mechanical galvanizations C3 and N2000 should not be used in conditions that would be more corrosive than AWPA UC3A (exterior, above ground, rapid water run off).
5. Some chemically treated wood may have chemical retentions greater than specification, particularly near the surface, making it potentially more corrosive than chemically treated wood with lower retentions. If this condition is suspected, use Type 316/305/304 stainless-steel, silicon bronze, or copper fasteners.
6. Some woods, such as cedars, redwood, and oak, contain water-soluble tannins and are susceptible to staining when in contact with metal connectors and fasteners. According to the California Redwood Association (calredwood.org), applying a quality finish to all surfaces of the wood prior to installation can help reduce staining.
7. Anchors, fasteners, and connectors in contact with FRT (fire retardant treated) lumber shall be hot-dip galvanized or stainless steel, unless recommended otherwise by the FRT manufacturer. Many FRT manufacturers permit low-corrosion-resistant connector and fastener coatings for dry-service conditions.
8. Simpson Strong-Tie does not recommend painting stainless-steel anchors, fasteners, or connectors. Imperfections or damage to the paint can facilitate collection of dirt and water that can degrade or block the passive formation of the protective chromium oxide film. When this happens, crevice corrosion can initiate and eventually become visible as a brown stain or red rust. Painting usually does not improve the corrosion resistance of stainless steel.

### Coatings and Materials Available

Inspire backyard transformations.

The best vacation spot can be your own backyard. Inspire your clients to create an outdoor getaway with deck software that provides impressive 3D visuals along with all the back-end data — live dimensions, structural hardware, materials lists — to build a safe and beautiful deck.

With the Deck Planner Software™, deck plans are faster and easier than ever. Visit go.strongtie.com/deckplanner.
Outdoor Accents decorative hardware.
Your customers can easily add beauty and strength to their outdoor projects. The Simpson Strong-Tie® Outdoor Accents line of structural connectors features an innovative screw and washer that together combine the ease of installing a screw with the look of a bolt. And, with a black powder-coat finish, this hardware offers style that’s designed to last.

To see our full line of decorative hardware, visit us at go.strongtie.com/outdooraccents.
